The ABO Discrepancy Index (DI)
A Measure of Case Complexity

Updated 11.14.2013
Target Disorders for Discrepancy Index

1. Overjet
2. Overbite
3. Anterior Open Bite
4. Lateral Open Bite
5. Crowding
6. Occlusal Relationship
7. Lingual Posterior Crossbite
8. Buccal Posterior Crossbite
9. ANB Angle
10. SN-MP Angle
11. Lower Incisor to MP
12. Other
Occlusion for plaster models is determined by placing the separated, properly trimmed study casts (Mx/Mn) on a flat surface and then bringing them together into maximum intercuspidation. All measurements must be made from this position. For digital models, measurements will be made from a standard 3D orientation that is described in ABO Digital Model Requirements.
Overjet (horizontal overlap) Relationship

Overjet Measurements

- For $\geq 0$ to $<1$ mm, score 1 pt (edge-to-edge)
- For $\geq 1$ to $\leq 3$ mm, score 0 pts
- For $>3$ to $\leq 5$ mm, score 2 pts
- For $>5$ to $\leq 7$ mm, score 3 pts
- For $>7$ to $\leq 9$ mm, score 4 pts
- For $>9$ mm, score 5 pts

Overjet is a measurement between two antagonistic anterior teeth (lateral or central incisors) comprising the greatest overjet and is measured from the facial surface of the most lingual mandibular tooth to the middle of the incisal edge of the more facially positioned maxillary tooth.
Negative Overjet Relationship

If there are anterior teeth with negative overjet (canine to canine in anterior crossbite > 0 mm), measure from the facial surface of the maxillary tooth to the middle of the incisal edge of the mandibular tooth. Round any fractional remainder to the next full mm, then score 1 pt per mm per anterior tooth in crossbite.
Overbite is a measurement between two antagonistic teeth (lateral or central incisors) comprising the greatest overbite.

• For > 0 to ≤ 3 mm, score 0 pts.
• For > 3 to ≤ 5 mm, score 2 pts
• For > 5 to ≤ 7mm, score 3 pts
• If any of the lower incisors are impinging on the palatal tissues (≤ 0.5 mm) or there is 100% overbite (a complete vertical overlap of antagonistic incisors), score 5 pts.
For each anterior tooth in an edge-to-edge relationship (0 mm), score 1 pt. per tooth per opposing tooth.

For each anterior tooth in open bite, (> 0 mm), round any fractional remainder to the next full mm, then add 1 pt per mm per tooth in an open bite. No points are scored for any tooth that is blocked-out of the arch due to space deficiency or not fully erupted.
For each maxillary posterior tooth (from the 1st premolar to the 2nd molar) in an open bite relationship $\geq 0.5$ mm from its opposing tooth, measure cusp to cusp.

- Round any fractional remainder to the next full mm
- Then score 2 pts per mm of open bite for each tooth.
- No points are scored for any tooth that is blocked out of the arch due to space deficiency or not fully erupted.
Measure the most crowded arch (only one arch) from the mesial contact point of the right first molar to the mesial contact point of the left first molar. If there are conditions such as missing, fractured or decayed teeth, measure crowding consistent with your treatment objectives and be prepared to defend the score at your oral examination.
1. Md right lateral incisor = 7.0 mm
2. Md space = 3.0 mm
3. Md right central incisor = 1.0 mm of crowding
4. Md left canine = 9.0 mm
5. 0.0 space available for md left canine
6. Therefore, crowding irrespective of arch form position **is estimated** at 14.0 mm of dental crowding.
Occlusal Relationship

Models must exhibit the patient’s maximum intercuspation. The Angle molar classification is used.

Molar classification is then determined for each side of the arch:

• Locate the mesio-buccal cusp of the maxillary first molar. - demonstrated by red dot.
• Locate the two buccal cusps and two interproximal contact points of the mandibular first molar – demonstrated by blue dots.
If the relationship is beyond Class II or III, measure the additional distance, round any fractional remainder to the next full mm - Score 4 pts. plus 1 addl. pt per mm per side.

For DI scoring per side, the location of the cusp within the zones is an estimation.

2. B2-B3- End to End Class II- Aqua- 2 pts.
3. B3-B4- Class I- Green- 0 pts.
4. B4-B5- End to End Class III- Yellow- 2 pts.
5. B5-B6- Full Cusp Class III- 4 pts.
6. One (1) point is awarded for each additional zone mesial to B1 or distal to B6.
Lingual Posterior Crossbite

For each maxillary posterior tooth (from the 1st premolar to the 2nd molar) where the maxillary buccal cusp is >0 mm lingual to the buccal cusp tip of the opposing tooth, score 1 pt per tooth.

Total of 4 pts
For each maxillary posterior tooth (from the 1\textsuperscript{st} premolar to the 2\textsuperscript{nd} molar) where the maxillary palatal cusp is > 0 mm buccal to the buccal cusp of the opposing tooth, score 2 pts per tooth.
Cephalometrics

ANB $\geq 6^\circ$ or $\leq -2^\circ$ = 4 pts
   
   Each full degree $> 6^\circ$ add 1 pt
   
   Each full degree $< -2^\circ$ add 1 pt

SN-MP

$\geq 38^\circ$ = 2 pts

Each full degree $> 38^\circ$ add 2 pts

$\leq 26^\circ$ = 1 pt

Each full degree $< 26^\circ$ add 1 pt

1 to MP $\geq 99^\circ$ = 1 pt

Each full degree $> 99^\circ$ add 1 pt
Because it is not possible to include every clinical entity in an index, the additional category of “Other” is included to permit scoring of other conditions which may add to treatment complexity.
Other: Supernumerary teeth- one (1) point each
Other: Ankylosis of permanent teeth - two (2) points per tooth
Other: Anomalous Morphology of tooth size and shape (e.g. natural and/or iatrogenic) - two (2) points per tooth

![Peg-shaped lateral incisor](image)
Other: Impaction (except 3rd molars) of teeth - two (2) points for each tooth
Other: Missing teeth (except 3rd molars):
- Non-congenital - one (1) point per tooth
- Congenital - two (2) points per tooth

In this example, there are eight congenitally missing teeth, therefore 16 points are allocated.
Other: Midline Discrepancy

The midline for each arch equals the mid-point between the Mx central incisors and the Mn central incisors demonstrated by two vertical reference lines. The discrepancy is the difference between the two vertical reference lines measured in the horizontal plane.

Score two (2) points for 3 mm or more.

4.0 mm midline discrepancy = 2 pts.

Midline coincident = 0 pts.
For a maxillary central incisor space (diastema) of ≥ 2.0 mm, score 2 points.

For generalized spacing per arch in which there is ≥ 0.5 mm of space on both sides of any 4 teeth or more, score 2 points.
Other: Tooth transposition-score two (2) points for each event
Other: Skeletal asymmetry (treated non-surgically) – score three (3) points
(appropriate diagnostic information is recommended)
Other: Additional treatment complexities-
Score two (2) points for each occurrence

Example: ectopic eruption-
two (2) points

Example: ectopic eruption-
possible six (6) points
Examples of Potential Treatment Complexities

Not to be considered all-inclusive

- Significant Bolton Discrepancy (3 mm or greater)
- Severe enamel wear
- Multiple areas of shortened roots
- Deep curve of Spee
- Associated traumatic injury to multiple teeth
- Periodontally labile condition
- Severely angulated roots
- Severe bi-maxillary protrusion (critical anchorage case)
- Cleft lip and palate
- Craniofacial dysmorphologies
